

medisun® GS-10 / PS-20

INNOVATIVE HYPERHIDROSIS THERAPY

The user-friendly and almost painlessly therapy
against excessive sweating without any side effects

medisun® GS-10 / PS-20

INNOVATIVE PULSE-CURRENT THERAPY AGAINST HYPERHIDROSIS

About 1% of the population is suffering from excessive sweating of the hands, feet or armpits. The medisun® therapy has been a scientifically recognized treatment against hyperhidrosis for many years. It can lead to normally dry skin in 98% of all cases without medications or surgical procedures.

The medisun® hyperhidrosis therapy is absolutely safe, almost painlessly and without any side effects if correctly performed. Treatment consists of hand and foot baths. Special sponge pads are used to treat the armpits and the

face. The current strength can be individually adjusted and the maximum is limited.

Sophisticated safety concepts as e. g. the protection against electrical shock (pasture fence effect) and the smart immersion monitoring including overtreatment-protection function, offer maximum user friendliness with the medisun® therapy devices. The medisun® therapy devices are characterised by their simple operation and highest reliability at maximum effectiveness.

medisun® GS-10 – The basic version

The medisun® GS-10 uses the proven direct current technology in the field of tap water iontophoresis.

medisun® PS-20 – The comfort version

SPECIAL HIGHLIGHTS medisun® PS-20

- In the pulse current procedure, the current is clocked at a physiologically beneficial frequency. Feeling the therapy current almost gets lost.
- The PS-20 can save three different therapy settings (e.g. hands, feet, armpits). The application of the treatment becomes so easy due to the automatic procedure.
- The sense function allows reduction of the output performance to 50%. More sensitive patients, e.g. children, or sensitive areas like the armpits or the face can be treated more individually.

TECHNICAL HIGHLIGHTS medisun® GS-10 / PS-20

- Safety package with current limitation and electric shock protection
- Overtreatment protection and smart immersion monitoring
- Can be operated without an assisting person
- Therapy dose can be adjusted even during the treatment
- Face mask with electrodes (optional)
- Continuous preselection of the therapy dose
- Automatic therapy start without an external operation switch
- Smart microprocessor control with memory and timer functions
- Quick and easy cleaning due to membrane keypad
- Operating with 12V safety power supply

Accessories

The medisun® hyperhidrosis therapy

TREATMENT CONCEPT

The treatment concept consists of two phases: In the first stage (initial therapy), the treatment is performed and taught by the referring doctor. Sweat secretion will normalise after approx. 10 treatments. Monitoring by the doctor provides a proof of initial success which is often required by the health insurances. Due to the reversible character of the **medisun®** therapy, long-term treatment is indicated, which is performed at home, with the patient's own device. Depending on the severity of the condition, maintenance therapy involves one to three weekly sessions of approximately 10-15 minutes each.

The **medisun®** therapy can be prescribed by your doctor! The costs for a hyperhidrosis home therapy device are probably covered by the health insurance after an application for defrayal.

THERAPY DEVICES

The **medisun®** home therapy devices are characterised by their simple operation, maximum reliability and highest efficiency. This device concept was developed in cooperation with University Hospitals. The basic version **medisun® GS-10** allows the direct current procedure. The comfort version **medisun® PS-20** offers besides the more favourable pulse current procedure also other benefits for a flexible and comfortable therapy. To get further details, please see the related device information.

SAFETY CONCEPT

The **medisun®** therapy devices are CE-certified medical devices. Due to the smart microprocessor supported control, the dose values are consistent and reproducible. The **medisun®** devices provide sophisticated safety concepts, such as electric shock protection, the smart immersion monitoring and overtreatment-protection function and user friendliness at the highest level.

CONTRAINDICATIONS

Please ask your dermatologist about the **medisun®** therapy. Contraindications: Patients with pacemakers, metal implants and large skin defects, as well as pregnant women, should not perform this therapy. Please consult your doctor before using this device!
